BIRNBACH COPPERWELD ENAMEL ANTENNA WIRE

Steel core covered with copper and heavily enameled. Will not elongate because of its high tensile strength . . . which is several times that of enameled copper wire. It has low R.F. resistance and is ideal for transmitting doublet and directional antenna systems as it will maintain the frequency characteristics of the antenna because of its stretchless qualities.

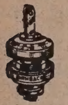
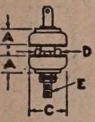
BIRNBACH STEATITE BUTTON





This specially designed steatite button is intended for use to simplify wiring and to be used as a binding post or a binding post insulator, or as a standoff insulator. Attention is called to the uniqueness of the design which prevents either section of the insulator from turning in respect to the special screw. The specially designed screw locks both sections.

TACO NOISE-REDUCING ANTENNA SYSTEMS

TACO ANTENNA EQUIPMENT

All Taco antennas are designed and manufactured to assure the serviceman and his customer of the most advanced antenna designs. Constant research in the laboratory and in the field assures mechanically and electrically perfect designs. Taco's workmanship is your insurance for long trouble-free performance. Taco Low-band antennas feature Jiffy-Rig construction whereby the installation man merely flips the antenna open and tightens a few screws and the antenna is ready for the roof. The Taco High-band antennas are assembled by the Taco Click-Rig method, whereby the elements are swung into place and automatically locked, due to a spring-loaded action.

For the complete Taco antenna and accessory line, as well as complete technical data on the various antenna types, refer to Taco Catalog Number 35 and the various technical bulletins on individual antenna problems.

NEW 5-ELEMENT TWIN-DRIVEN YAGI

SPECIAL HIGH GAIN MODEL

A new antenna design incorporating the advantages of both the Twin-Driven Yagi and the 5-Element design. High gain provides reception in extreme fringe area installations where ordinary antennas fail. Excellent front-to-back ratio eliminates venetian-blind effect caused by co-channel interference.

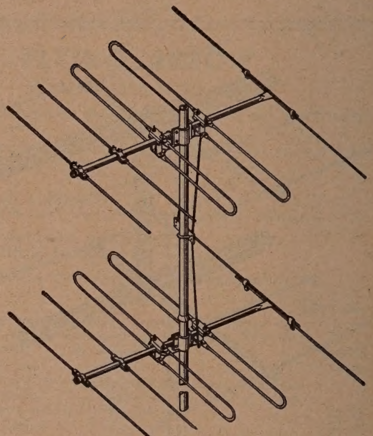
Antenna consists of two directors, two folded-dipole antenna elements driven in parallel, and one reflector. The antenna elements driven in parallel raise the inherently low impedance of the Yagi design to match 300 ohm leadin, thus getting maximum energy from the array.

The 5-Element Twin-Driven antenna is designed primarily for fringe area installations. It is also used in many noisy locations in order to raise the signal-to-noise ratio. Unwanted signals are rejected due to the narrow beam width and sharp directivity of the antenna and the high gain minimizes the effect of noise pickup in the transmission line.

Light in weight, yet unusually sturdy, the Super 980-(*) is ideal for use with a rotator. Mechanically, the new antenna will withstand extremes in weather conditions.

The Super 980-(*) is available as either a single or stacked array, depending upon the available signal strength. The antenna is completely factory-assembled in the famous TACO Jiffy-Rig manner that requires only a few minutes to ready it for installation.

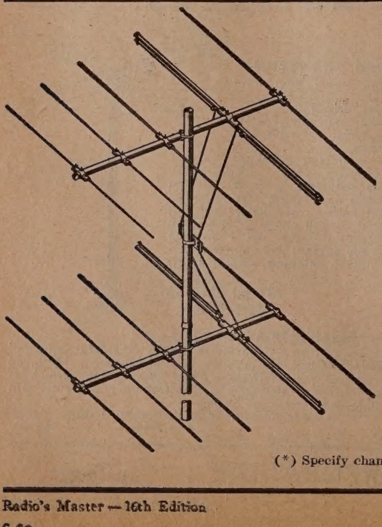
Comes tuned for any one of the low-band channels and is available in a stagger-tuned model, Super 980-(4½) or Super 981-(4½), that will receive both Channels 4 and 5. Specify channel desired.



CAT. No. SUPER 980-(*)—5-Element Two-Bay Twin-Driven Yagi Antenna less mast. (Ship. Wt.: 14 lbs.)............**List Price $47.00**

CAT. No. SUPER 981-(*)—5-Element Single-Bay Twin-Driven Antenna less mast. (Shipping Weight: 7 lbs.)............**List Price $23.00**

CAT. No. 989-(*)—Transmission lines for stacking 2 single-bay No. Super 981 antennas. **List Price $5.25**



5-ELEMENT LOW BAND YAGI

The Taco 5-element Yagi is designed for the sub-fringe area same as the Twin-Driven Yagi shown above. It employs a two diameter type antenna section for stepping up the impedance of the antenna itself. With the directors and reflector element cut for each channel the match is correct for a 300 ohm transmission line.

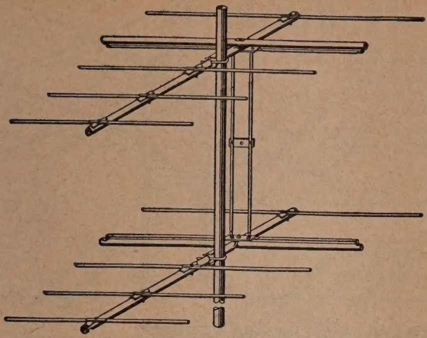
The three directors give the antenna a very narrow pattern which helps to keep out ghosts and unwanted reflections. In areas with mountainous terrain a single bay antenna is frequently the only practical answer to the bothersome reflection problem.

The Taco 5-element Yagi is ruggedly built of hard-tempered heavy wall auminum, designed with a high factor of safety — it's the "Storm-Proof" antenna.

CAT. No. 1325-(*)—ONE BAY YAGI ANTENNA. Consists of: 1 crossarm with U-bolt and saddle; 1 two-diameter driven antenna; 1 reflector and 3 directors mounted on crossarm. (Shipping Weight: 7 lbs.)........................**List Price $16.00**

CAT. No. 1326-(*)—TWO-BAY YAGI ANTENNA. Consists of: 2 Cat. No. 1325-(*) assemblies with stacking lines. (Shipping Weight: 14 lbs.)........**$35.00**

(*) Specify channel desired: 2, 2½, 3, 3½, 4, 4½, 5, 5½, 6.



CLICK-RIG 5-ELEMENT YAGIS

FOR CHANNELS 7-13

TACO's Click-Rig feature is a spring-loaded, fully automatic construction for rapid, foolproof erection. Used in all High-band antennas. Reception in the high frequency TV channels, especially for long distance reception, is often bothered by ghosts and weak signals. This is in part due to: greater loss in lead-in at the higher frequencies; lower sensitivity of the receivers in the high band; lower signal pickup due to shorter antenna elements.

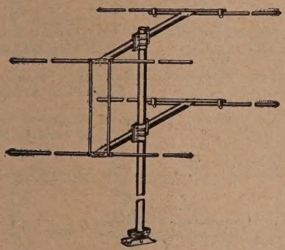
To overcome these disadvantages it is recommended that high gain Yagi antennas, either single bay or stacked two bay Yagi's be used wherever possible. Higher gain antennas improve the signal-to-noise ratio at the receiver terminals, sharper directivity patterns reduce reflections and thus ghosts. A single-bay Yagi will cover 3 to 4 channels whereas a stacked unit will cover only a couple of channels due to the sharp tuning of the elements.

A High-band Yagi can be coupled with a low-band antenna by a Cat. No. 885 Matching Harness for feed through one single transmission line.

CAT. No. 1350-(†)—ONE-BAY YAGI ANTENNA. Consists of: 1 two-diameter antenna element, 1 reflector and 3 directors mounted on crossarm; U-bolt and saddle. (Shipping Weight: 2 lbs.) **List Price $8.00**

CAT. No. 1351-(†)—TWO-BAY YAGI ANTENNA. Consists of: 2 crossarms with U-bolts; 1 two-diameter antenna element, 1 reflector and 3 directors mounted on each crossarm; stacking lines. Click-Rig construction. (Shipping Weight: 5 lbs.) **List Price $16.50**

(†) Specify channels desired: 7, 8, 9, 10, 11, 12, 13)

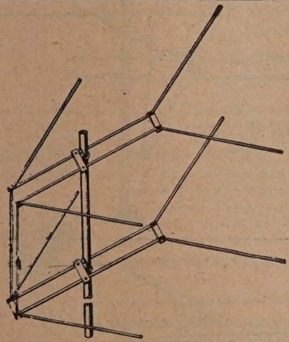


LOW-BAND ALL-CHANNEL LAZY-H ANTENNA

TYPE 935

One of TACO's most famous antennas. Known as "old dependable." Lazy-H design with reflectors provides very high gain throughout the low-band. Used in many fringe areas as a stacked array. Improved electrically and mechanically over original design. When rotated 35° off broadside direction serves as excellent high-frequency antenna. Many of these antennas have been in service for as long as ten years.

CAT. No. 935-LM—LAZY-H ANTENNA. 2 antenna-reflector mounted on separate crossarms mounting clamps stacking lines. (Shipping Weight: 6½ lbs.) **List Price $19.50**



TWIN-DRIVEN-CORNER ANTENNA

The TACO Twin-Driven Corner Antenna is a recent development in the line of all-channel antennas. It has an extremely high gain in channels 7-13. Its single lobe characteristic helps to reduce interference. It is recommended for all but the very fringe areas.

The Twin-Driven feature insures a stable field pattern as driven elements are easier to control than parasitically fed elements. It also accounts for the high front-to-back ratio.

Mechanically, this antenna is extremely light and rigid. It has low wind resistance which assures a quiet installation free from howling sounds. It is ideal for use with a rotator due to its high directivity and low weight.

May be stacked four high for extra gain in fringe areas.

CAT. No. 1700L—Stacked Twin-Driven Corner Antenna, consisting of: 2 bays of antennas with transmission line-crossarm; U-bolt mounting; stacking line with terminal panel and brace. (Shipping Weight: 6 lbs.)....**List Price $20.50**

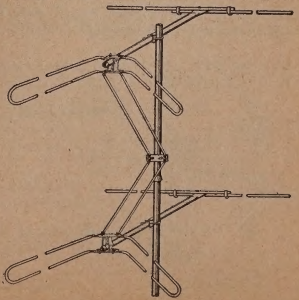
CAT. No. 1703—Single Bay Twin-Driven Corner Antenna, consisting of: two antennas with transmission line crossarm; U-bolt mounting. (Shipping Weight: 4 lbs.) **List Price $8.50**

FOLDED-VEE ALL-CHANNEL ANTENNA

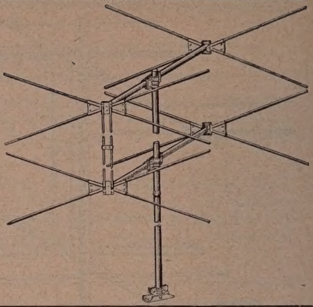
The latest TACO all-channel design. Combines all the inherent broadband characteristics and mechanical rigidity of the folded dipole, along with the advantages of the conical forward angle. Excellent gain throughout all 12 TV channels. Recommended for medium signal strength areas. Available as single or stacked array. Folded dipole design results in an extra strong antenna mechanically.

CAT. No. 1400—Folded-Vee Antenna. Folded Dipole-Reflector with mounting V-bolt assembly. (Shipping Weight: 3 lbs.)........**List Price $12.50**

CAT. No. 1402—Stacking Lines for converting two No. 1400 into stacked array. (Shipping Weight: 2 lbs.)........**List Price $5.25**



LAZY X ANTENNA SERIES 950AL



One of the most popular types for areas where several channels are operating in both bands; introduced by Taco in 1940, the Lazy X has proved its versatility in both bands through its high gain, and stability of impedance at different frequencies. High front-to-back ratio helps eliminate reflections and co-channel interference from sides and rear. Available as either a 2 or 4-bay stacked array or as a single antenna. Stacked array providing approximately twice the gain of the single antenna. Matches popular 300-ohm lead-in. All Aluminum construction.

CAT. No. 950AL—Stacked Lazy X Antenna for Channels 2-13. 2 X-Antenna-reflectors, Connecting transmission line between antenna, accessories. (Shipping Weight: 12 lbs.) **List Price $31.00**

CAT. No. 953A—Single Lazy X antenna less mast (Shipping Weight: 5 lbs.) **List Price $14.00**

TRI-X ANTENNA SERIES

This antenna has been designed to provide extra gain on the upper end of the high-band. Where channels 11, 12, or 13, are weak, this antenna will outperform the Lazy-X design. The forward angle has been greatly increased over the Lazy-X. The single rod reflector provides practically the same gain as the X-type reflector. All aluminum construction.

CAT. No. 1000—Stacked Tri-X antenna. Jiffy-Rig construction, 2 single-bays with transmission line for stacking. (Shipping Weight: 10 lbs.)................**List Price $25.00**

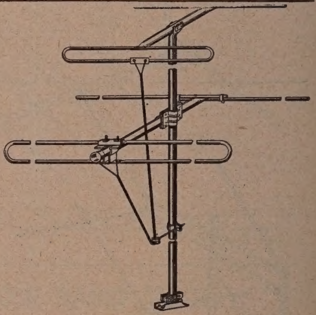
JIFFY-RIG TELEVISION ANTENNAS

HI-LO BAND ANTENNA TYPE 925L



An improved version of the original TACO Hi-Lo Band Antenna. Used in medium to high signal strength areas where both bands are operating. Has advantage of independent orientation for each antenna. Matching network minimizes interaction between elements and makes possible the use of one lead-in. In weak signal areas, separate leads from high and low with a switch at the receiver are recommended, or the addition of the special TACO No. 885 network. Sturdily constructed.

CAT. No. 925L—Hi-Lo Band Antenna. High and Low-band folded-dipole antenna-reflectors, matching stub, accessories, mast swivel base. (Shipping Weight: 5 lbs.)....**List Price $16.00**

A modification of the Hi-Lo band antenna for service in fringe areas where the signals are weaker. Yagi design in both the high and low-band elements gives added gain and directivity.

CAT. No. 921L-(*†)—Hi-Lo Band Yagi Antenna. 1 Yagi high-band antenna, 1 folded dipole low-band antenna, matching network, accessories. (Shipping Weight: 5 lbs.)...........................**List Price $21.00**

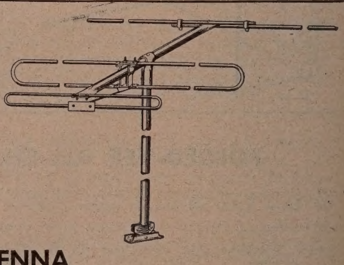
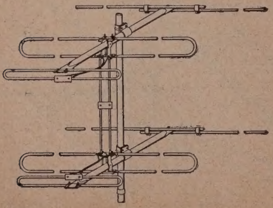
HI-LO BAND IN-LINE ANTENNAS



An all-channel antenna that features simplicity and compactness. Designed for average strength areas where all channels are received from one direction, or for use with a rotator. On the high-band, the low-band antenna acts as a reflector for the high-band antenna. Broad-band folded dipoles show good impedance stability over both bands. Connecting stub works efficiently in most locations of fair signal strength.

CAT. No. 930L—Hi-Lo Band In-Line Antenna. In-line hi-lo band antenna, connecting stub. (Shipping Weight: 5 lbs.)..**List Price $14.50**



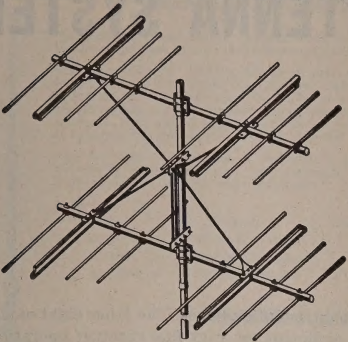
STACKED IN-LINE ANTENNA

Designed for areas where both the high and low bands are desired, this antenna provides almost twice the gain of the single in-line antenna. Antennas are stacked to provide a more constant gain over the 12 channels than the single array. May be used as a higher gain antenna in weaker areas, or again as a broad-band antenna in locations where many channels are received. Ideal for use with rotator, being a single lobe antenna. Matches 300-ohm lead-in and receiver input.

CAT. No. 932L—Stacked In-Line Hi-Lo Band Antenna. 2 In-line antenna-reflector assemblies, stacking transmission lines, mounting hardware. (Shipping Weight: 9 lbs.) **List Price $27.50**

JIFFY-RIG TELEVISION ANTENNAS

TANDEM YAGI ARRAY



The optimum in high-band reception. For the toughest assignments in high-band installations. Exclusively TACO design and manufacture. This antenna will produce acceptable results where other antennas produce nothing.

In addition to the high gain, this antenna has the advantage of matching either 300 or 72 ohm line with no modifications. The four Yagi antennas are brought together by 300 ohm transmission lines to one terminal post which has 72 ohm impedance. A ¼ wave transformer is used to step up the impedance for connection to a conventional 300 ohm ribbon transmission line. In noisy locations it may be desirable to use 72 ohm coax, and therefore this antenna offers a real advantage in this respect.

CAT. No. 967L-(†)—Tandem 16 Element Antenna, consisting of: 4 Yagi arrays, 2 crossarm assemblies with U-bolt mounting clamps; four 300 ohm connecting links; two ¼ wave length matching transformers with terminal panel; two 1¼" dia. (Shipping Weight: 8 lbs.)............**List Price $32.75**

FM ANTENNAS

FM OMNIDIRECTIONAL ANTENNA TYPE 624

Available as either a single antenna or stacked array for the weaker areas. As stacked array, it may be peaked for the weakest station.

CAT. No. 624-L—Omnidirectional antenna, "S" type folded dipole with terminal, 5-ft. mast, accessories. (Shipping Weight: 5 lbs.) **List Price $7.50**

TACO NOISE-REDUCING ANTENNA SYSTEMS

TACOPLEX MASTER ANTENNA SYSTEM

FOR APARTMENTS

FOR COMMUNITIES

FOR STORES

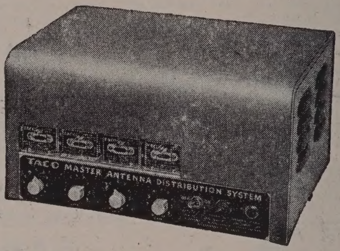
A product of one of the oldest designers and manufacturers of master antenna systems in America—TACO. A result of years of research into the requirements of master TV antenna systems for apartments, stores and communities.

The TACOPLEX Master Antenna Distribution System amplifies the TV signals and provides means for mixing and distributing them. As many as 200 TV receivers can be operated from one Master Chassis. However, several master chassis can be interconnected and operated from one set of antennas. In community systems one antenna system can easily feed 500 receivers. All equipment has been designed and manufactured to provide the dependable day-in, day-out service required by installations in apartments, stores and community installations.

The TACOPLEX System consists of the antenna array, the power amplifier and isolation boxes. All connections are made through coaxial cable to minimize noise pickup, and afford complete flexibility.

The required array is the TACO Yagi type antenna, for maximum signal-to-noise pickup. The signal is fed into the TACOPLEX power amplifier where individual, plug-in type amplifier strips boost the signal 200 times. Each amplifier strip has an individual gain control, thus making it possible to have all channels traveling in equal strength to the receivers. The signals are then fed through a mixer chassis that funnels all signals into the leads connected to the isolation boxes.

The mixer chassis is available in two models—tube-type and tubeless. The tube-type is ideal for store installations as it provides ten outlets. Two of high signal strength which can be used for the service shop where many receivers may be connected to them through isolation boxes. The other eight of signal strength sufficient for very fine receiver operation at the point of demonstration. The use of such a system in TV merchandising opens new opportunities for dealers. The tube-type mixer is successfully used for signal distribution in community installation systems. One thousand feet coaxial cable runs to distant receivers are practical.



The tubeless type of mixer chassis provides two high-signal-strength outlets which feed into transmission lines to the isolation boxes.

The new TACO isolation box-type 1585 is of the non-powered type providing complete isolation with minimum power drain from the transmission line. By using several master chassis in series, hundreds of receivers can be fed from one lofty antenna array.

The system using the tubeless type of mixer chassis is recommended for apartment house installations where one TACOPLEX System will provide television service for up to 200 TV receivers.

The present TACOPLEX System is used for Community Service installations where a master antenna is installed for a whole community, and the signal, via a high powered TACOPLEX System, is distributed to subscribers. This makes possible television in many communities beyond the useful range of stations, and has been used in communities as far as 100 miles from the transmitter.

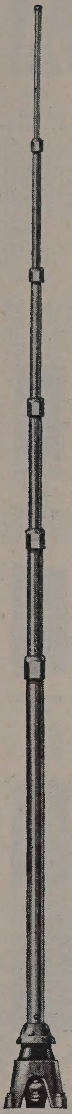
PREMAX Telescoping and Whip Antennas

PREMAX STAINLESS STEEL AUTO-MANIC ANTENNA



The Premax "Auto-Manic" Antenna can be raised or lowered with one hand, thus meeting the need for a marine installation that can be lowered simply and easily when passing under bridges or other obstructions.

The "Auto-Manic" locking device on each of the telescoping sections is free to move when the sliding sections travel upward and binds them securely when reverse pressure is applied. Each section can be extended inches at a time with one hand and will lock at any point. At full extension of each section, a positive locking action occurs which is proof against severe strains and vibrations. To lower the antenna, it is only necessary to raise a special ring on the base section which releases the lower lock. As the second section telescopes into the base, it releases the second lock and so on until the entire antenna is retracted, making about a 6′ unit.

The Antenna is made up of sections of a special grade of welded stainless steel tubing, hard-drawn to an extremely high tensile and yield strength. Made in three, four and five sections. Standard Premax Mountings and Insulators will fit these Antennas.

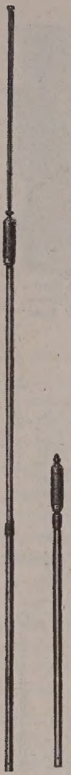
SERIES B CENTER LOADED ANTENNAS FOR 2 TO 8 MC. COVERING AMATEUR "75", MARINE, AIRPORT, C.A.P. AND PUBLIC SERVICE FREQUENCIES



Type C Center-Loaded Antenna 2 to 3 Mc.

Premax Center Loaded Antennas are practically a "must" for efficient operation on all communication frequencies—mobile and marine—between 2 and 8 Mc. The basic 75 meter Antenna covers the entire mobile phone band. Other coils are available to cover the 2,000 to 3,000 Kc. marine, airport 3105 Kc., CAP 2374 Kc. and public service frequencies.

The 75 meter Mobile Antenna consists of a 6-foot tapered whip of either high-tensile aluminum alloy, high-tensile stainless steel or high-carbon heat-treated steel, mounted above a loading coil and a special aluminum alloy base rod 24 inches long, with couplings to fit any standard Premax Mount. Coil is wound on a specially treated wood form, weatherproofed after winding with low-loss insulating varnish.

With this Premax Center Loaded Antenna, a gain of 8 decibels or more can be secured over conventional "whip" types, which is equivalent to multiplying the power by 6.3 times. The importance of this gain is immediately apparent as it is a most inexpensive way of extending both the transmitting and receiving range.

This antenna may also be used for multi-band amateur operation by shorting out turns (approximately 75% on 14 Mc.) or by completely jumpering out the coil to make an efficient quarter-wave antenna on 10 meters.

Where it is not possible to utilize a 9½-foot antenna, the base section may be omitted. This results in a base-loaded Antenna with an effective gain of 6 decibels—equivalent to quadrupling the power over a plain type antenna.

SERIES C CENTER-LOADED TELESCOPING MARINE ANTENNA, 2 TO 3 MC.

The Premax Center-Loaded Collapsible Vertical Antenna, Type C, is especially designed for marine use and gives a remarkable gain over the signal produced by a straight vertical where the loading coil is housed in the transmitter cabinet. At the high-frequency end of its 2,000 to 3,000 Kc. range it gives a measured effective signal power gain of 6 decibels . . . equivalent to quadrupling transmitter power output.

This Antenna consists of two telescoping, adjustable base sections of seamless aluminum, monel or stainless steel tubing on which the loading coil is mounted, with a tapered top whip section. The total extended length is about 17 feet. The base section collapses to a single unit and the whip section telescopes through the coil into the lower sections, making a collapsed length of 7 feet. Coil is wound on low-loss bakelite tubing and treated after assembly with weatherproof varnish.

The base presents such a low impedance that little loss is experienced due to icing, wet weather or water spray. The line feeding the base is a low impedance line and is not critical as to length and body-capacity effects.

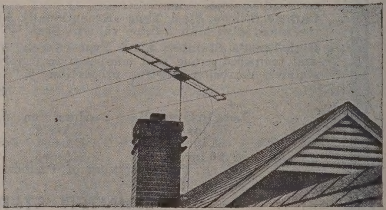
PREMAX ROTARY BEAM KIT—6, 10, 11 METERS

A 20-pound Beam for 6, 10 and 11 meters, built to commercial standards! Has a braced frame of heavy-duty angle aluminum and solid fibre insulation blocks that will not crack or snap under vibration and shock. Each telescoping element can be tightly clamped to provide positive connection. Parasitic elements may be left open at the center with tuning hairpins inserted or may be used as six elements on 6 meters.

The RB-6309 Kit includes frame and three pairs of elements with necessary insulators and hardware, including T-match accessories but without transmission line. Complete in single carton.



PREMAX CORULITE ELEMENTS

Premax Corulite Elements are designed to meet the need for lightweight but sturdy elements for use in horizontal arrays and similar applications. They are unusually light in weight and their special corrugated or reeded design provides exceptional strength and rigidity so essential in horizontal types of installation. All parts are heavily electro-plated to provide corrosion resistance and high electrical conductivity. A positive clamp, spot-welded to the tubing, permits adjustment in length and assures rigid joints and positive electrical contact between the telescoping sections. Ease of adjustment between the two halves of each component element is provided by the Premax "Hairpin" Tuning Bar. By its use it is possible to have all of the elements set at a single physical length and the variation in their electrical length may be accomplished by the "Hairpin."

Corulite Elements are available in two or four-section units as shown in the specifications below. These elements meet all requirements for the various arrays in general use and are ideal for combinations in commercial, FM, television or amateur bands.

MODEL 2VV — Double-stacked DUBL-VEE Antenna with twin lead cable harness connecting bays.

MODEL 2VV-A — Deluxe Double-stacked DUBL-VEE. Employs carefully engineered stacking bars to connect bays and make the entire assembly more rugged.

SERIES A — 3-Element TV Antenna — This is a high-gain (5 db.) directional antenna, made in 12 models — one for each TV channel. It is the basic unit of all WORKSHOP multi-channel systems and provides the ultimate in television reception. Designed for use with coaxial cable, ghosts, snow, and all types of interference are cut to a minimum. Elements are rugged, lightweight, ½ inch duraluminum. Pre-assembled, fold-up elements make installation fast, easy, foolproof — clamps on masts up to 1¼ inches in diameter. For multiple mounting on a single mast, see table.

SERIES 2A — Super High-Gain 6-Element Array — This array consists of two 3-element Series A bays spaced ½ wave apart and connected by a cable harness. Gain is 7.8 db. on its specified channel and 5 db. on adjacent channels. Provides outstanding reception up to 100 miles. Uses RG/8U or other 52 ohm coaxial line. Can be used with 300 ohm line in conjunction with Model T-300 matching transformer.

AMATEUR ANTENNAS — The Workshop offers a complete line of antennas for all amateur bands — 2, 6, 10 and 20 meters and for UHF. For exceptionally high gain on the 6- and 10-meter bands, double-stacked arrays are available. Write for "Amateur" Catalog.

TELEVISION ANTENNAS

COMPLETELY NEW DESIGN — BUILT TO LAST RCA 12-CHANNEL TELEVISION ANTENNA — TYPE 204A1

BASED UPON YEARS OF FIELD EXPERIENCE

• Easily Assembled • Ruggedly Constructed • Uni-Directional

Here's an RCA "Leader" to meet the majority of your everyday antenna needs. Engineered and developed by RCA for plus-value service, RCA-215A1 is intended for use in most receiver locations where both high and low-frequency stations are in the same general direction. Unique RCA "V" attachments provide uniform directional characteristics for all 12 channels.

RCA-215A1 12-Channel Television Antenna is simple in design and appearance. Sturdily built of aluminum, it will withstand high winds, sleet, and ice. Designed for use with 300-ohm transmission line, the 215A1 rates "A" for antenna achievement: — for over-all performance and unusually flat response over each of the two television bands. Supplied with all necessary hardware but less mast. Completely illustrated instructions for installation are included.

THE RCA REVERSIBLE-BEAM TV ANTENNA ARRAY — TYPE 212A1

For Locations with Co-channel Interference

The RCA Reversible-Beam TV Antenna Array receives signals from only one direction at a time; eliminates co-channel interference where stations are approximately 180° apart. It also eliminates adjacent-channel interference where the receiver lacks selectivity. RCA-developed "V" attachments provide uniform directional characteristics for all twelve channels. A high overall front-to-back ratio is achieved through the use of driven elements, instead of parasitic elements. This design also makes possible the unique feature of lobe switching.

Sturdily built throughout of high-quality aluminum, the RCA Reversible-Beam Antenna consists of an array of four eight-foot dipoles in the form of a square. A dual transmission line connects the horizontal and vertical dipoles to an attractively packaged diplexing network located at the rear of the receiver. By the mere flick of a switch on the diplexer, antenna directivity can be reversed.

The VEE-D-X divider network is a great new development that permits the use of a single transmission line between separate high and low antennas mounted on same mast. Saves transmission line — saves installation time and money — saves extra accessory costs.

HOW MIGHTY MATCH OPERATES

The Mighty Match isolates the high and low channel antennas by preventing the undesirable high frequency signal received by the low band antenna from entering the transmission line. The Mighty Match also eliminates the partial shunting effect of the high band on the low band antenna.

"CONICAL-V-BEAMS"

The only Antenna that can produce FULL TONE, FULL VIDEO and Highest Signal to Noise ratio on all Frequencies!

TECHNICAL NOTES

Telrex "Conical-V-Beams" technically and practically assume characteristics similar to solid cones, giving broad band and high gain response with full audio and video band pass over the entire television frequency range. *Therefore, "Conical-V-Beams" outperform any other antenna.*

* * *

Nominal center impedance is 150 ohms and non-varying due to conical configuration. The dipoles are tilted forward presenting a "V" to the incoming wave, forcing the forward lobe to remain in line irrespective of channel being received. Thus the Telrex dipole is an effective ½ wave element on channel 2, increasing to ⅝ wavelength on channel 3, and increasing in effective "V" beam action to channel 13 where it becomes a full wavelength on each leg with the maximum receiving lobe being in line. The reflectors are effective at all frequencies with a front to back ratio of better than 12 DB on all frequencies. *The "Conical-V-Beam" is the only antenna which can produce in this manner.*

* * *

Unlike other methods of covering both bands, Telrex antennas do not introduce phase shift or favor one band versus the other and only one transmission line is used. Where stations are displaced beyond the normal acceptance lobe of a single "Conical-V-Beam" or array, the DO-X (Duo Orienting) array is recommended. This permits separate orientation of two groups of stations at any angle. Only one transmission line is needed due to the unique Telrex coupling line and phasing loop.

* * *

When the stations are within a 5 to 15 degree sector, the Telrex antenna used for maximum efficiency at low frequencies becomes a much more efficient antenna on the high frequencies than a separate cut-to-frequency stacked antenna.

* * *

The 150 ohm non-varying center impedance makes it possible to use any of the commercially available transmission lines from 75 ohm coaxial, to 300 ohm ribbon, with a standing wave ratio never exceeding 1.6 to 1 on any channel. Standing waves cause excessive phase-shift, blurred pictures, multiple images and decreased sensitivity.

* * *

"Conical-V-Beams" will outperform any cut-to frequency antennas.

* * *

You are invited to consult our engineering staff on any unusual antenna problems.

* * *

"Conical-V-Beams" are produced under Re-issue Patent No. 23,346.

Series 75 Microphone Connectors—Single Contact

Fit almost every microphone. Standard with leading manufacturers for many years. Compact, rugged, neat. Chassis receptacles are integral parts of microphones using single conductor cable. Widely used in amplifiers, transmitters, phonoelectric devices, home recorders and similar equipment. They are also suitable for connecting various units such as PM speakers, headphones, and for theft alarms or wall type coin operated devices, etc.

In the 75 Series, plugs mate with all cable jacks and receptacles. Circuit closing contacts are the same except that they close the circuit when plug is disengaged, eliminating open circuit grid howls.

Locknut Receptacles mount in .385″ holes when grounding to chassis and ½″ holes for ungrounded 2 circuit applications.

Amphenol Coax and Twinax RG Cables

Amphenol Coaxial and Twinax RG Cables are produced to standards surpassing military specifications for electrical performance and mechanical excellence. Conductors are centered 20% closer for Coax and 50% closer for Twinax Cables than required by "AN" specifications.

Most cables utilize the exceptional dielectric properties of polyethylene—low loss, flexibility, mechanical stability. The outer jacket in the majority of approved types is a tough, highly resistant vinyl jacket which is non-hygroscopic and impervious to most acids, alkalies, oils and gasoline. Other types are armored for still greater mechanical protection.

Amphenol has cables that are designed to operate efficiently at temperatures as high as 500° Fahrenheit. Teflon is used as the dielectric because of its low loss, high voltage breakdown and its ability to withstand heat.

MODEL No. 509

Designed to rotate in one direction only, the Amphenol "Auto-Dial TV Antenna Rotator utilizes a single directional motor, permitting greater power and higher torque than usually available in reversible motors. The antenna rotates rapidly—only 22 seconds required for a complete revolution. Positive braking action prevents coasting or backlash.

The "Auto-Dial" permits axis or "in-line" mounting of antenna and supporting mast, allowing equal weight distribution on the steel bearings and gears of the rotator. There are no fiber or laminated gears to fail—all gears are steel.

The attractive control unit houses the relay, automatic step gears with nylon insulation, contact breakers, and sturdy transformer that reduces 115 volt A.C. to 24 volt A.C. required by the rotator motor.

The new "Auto-Dial" Rotator for the first time permits accurate antenna field strength measurements because it can always be brought back to exactly the same direction. This is possible because rotation is in steps of 6 degrees, accurately calibrated on the direction indicator. With "Auto-Dial," servicemen are now able to determine whether the antenna is functioning properly, has the best front-to-back ratio and if it is located properly for the best possible picture.

Operating the rotator is as simple as ABC. (A) Turn switch under dial to "On" position; (B) if necessary, refer to log card for dial number indicating desired antenna direction; (C) turn knob until pointer lies over proper number. Then, automatically, the inside knob, which rotates in synchronism with the antenna and which has an arrow—turns to line up with the pointer. This indicates that the antenna is rotating. When the desired direction is reached, rotation stops automatically.

"500" SERIES PLUGS AND SOCKETS

For Complete Listing of 500 SERIES, Write for No. 500 Catalog

Designed for 5,000 volts and 25 amperes per contact. Circuit characteristics, however, may alter this rating one way or the other.

Long leakage path from terminal to terminal, and terminal to ground. Contacts are brass and phosphor bronze, silver plated. Metal parts of caps and brackets are steel, parkerized (rust-proofed). Plug and socket blocks are interchangeable in caps and brackets.

All sizes are polarized in a manner to prevent a smaller plug being inserted in a larger socket. Thus different sizes may be used on one installation without danger of making wrong connections.

Extreme care has been taken to make terminal connections under cap very accessible both for original wiring and subsequent inspection. The cap is insulated with canvas bakelite. Plug prong cross section $\frac{5}{16}''$ x $\frac{3}{32}''$.

IMPORTANT: For safety with high voltages DEEP BRACKETS should always be used on one plug or socket, when the other plug or socket has a CAP. SHALLOW BRACKETS are for use only in connecting two units, each unit having plug or socket with SHALLOW BRACKET.

Cable entrance: Because of the great variation in type and size of cables, we have considered it best not to supply cable clamps of any kind. The cap end is made to accommodate standard BX clamps which may be obtained at any electrical jobbing house. The cap end will be furnished with round hole from ½" diameter and 1¼" diameter in steps of ⅛", if the size required is given on order. If no size is given, plain cap end with center punch locating center will be shipped.

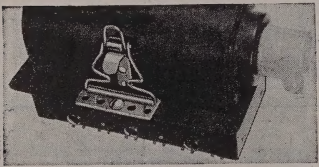
LOCKS FOR 500 SERIES PLUGS AND SOCKETS



Locks shown above are used in connection with any DEEP BRACKET and cap combination.

The locks securely hold the units together, but they can be released instantly.

The mounting plates are made to fit all DEEP BRACKETS, and are fastened by the same screws or rivets that hold the deep brackets to the panel. Can not be used on shallow brackets. Sold in pairs only.

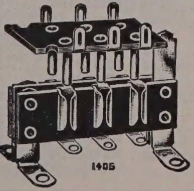
1400 SERIES PLUGS AND SOCKETS

This series of ''disconnect'' plugs and sockets has the distinct advantage of low cost for a separate unit handling many circuits. Due to exposed metal parts, it is recommended for use when the complete unit is within a housing.

Reduces costs of servicing units. Advantageous in shipping when it is desirable to pack units separately. Polarized—assures correct coupling. Spring temper brass sockets assure perfect contact. Standard units are listed below from 5 to 16 contacts. However we can supply units having as many as 30 or more contacts.

On No. 1420 or larger we recommend the plug be divided into two or more units, as a single long plug is not mechanically strong. The socket will be made in one assembly.



No. 1405	(5 Contacts)	**Ea. $0.39**	**No. 1411**	(11 Contacts)	**Ea. $0.75**
No. 1406	(6 Contacts)	**Ea. .45**	**No. 1412**	(12 Contacts)	**Ea. .81**

No. 1410	(10 Contacts)	**Ea. .69**	**No. 1416**	(16 Contacts)	**Ea. 1.06**

For units with more than 16 contacts, add 7c to the No. 1416 price for each additional contact.

BARRIER TYPE TERMINAL STRIPS

Increased insulation is provided by having Barriers placed between each Terminal. These Barriers follow around the edge of the Strips and terminate at the base. They not only make a long leakage path but prevent direct shorts from frayed wires at the terminals. Mounting holes are at the ends as illustrated. The base is molded Bakelite.

The Terminals and Binder Screws are of brass, nickel plated. **Marker Strips** may be ordered and imprinted to supply terminal designations. These Marker Strips mount beneath Terminal Strips and also afford insulation from metal mounting surface. **See page 21 for imprinting charges.** See pages 24 and 25 for dimensions.

Illustration at right shows a No. 3-162 A-R Fanning Strip connected to a No. 3-142 Barrier Strip.

Jones Fanning Strip Terminals are of .032" Brass, Cadmium Plated. The Bakelite strips are furnished with a hole in either the right or left end for fastening the cable with a cable clamp or lacing twine. Simplifies cable or harness wiring, assuring positive connections. Makes replacement of units an easy matter and assures correct connections after servicing.

In many instances where there is not sufficient room for the standard Fanning Strips we can supply those listed formed for right angle mounting permitting use when Barrier mounts flush with the side of the chassis. Specify Series 160A, 161A and 162A instead of 160, 161 and 162. Prices slightly higher.

ELECTRIC SOLDERING IRONS

These electric soldering irons embody features of design and construction that specialized experience dating from 1894 in the exclusive manufacture of electric heating appliances has demonstrated to be desirable for efficient and lasting service. Hundreds of thousands are in use throughout the world in a wide variety of manufacturing plants; in service, maintenance and repair shops and in telephone, telegraph, radio and TV stations. Because of their proven dependability, durability and efficiency they are preferred by those who measure the value of a tool or mechanical device by the service rendered.

No. 3128—For servicing TV, electronic and radio equipment and similar light work.

No. 3138—For TV, electronic and radio production; also for telephone, telegraph and similar work.

No. 3158—For the same purposes as the No. 3138 but for work requiring an iron of greater capacity.

No. 3178—For use on still heavier work than that for which the Nos. 3138 and 3158 irons are adapted.

No. 3198—For use on very heavy soldering operations of all kinds.

Made in standard voltages and for 32 volts. No. 3138 also made for 6, 12, 24 and 55 volts. All sizes can be equipped with 3-conductor cord, one wire grounded, at slight additional charge. Separate heat-insulating stand supplied with each iron.

TERMINAL CONDUCTOR ASSEMBLY

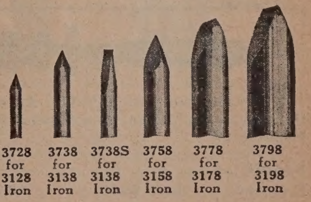
This illustration shows the Terminal Connector Assembly used in all American Beauty electric soldering irons. It is designed for use with either 2- or 3-conductor standard heater cord or rubber-covered cord—Types SJ, HSJ, etc.

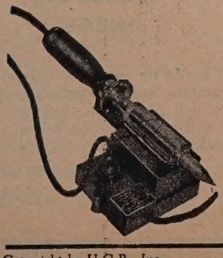
This assembly permits easy grounding for safety by a third conductor—particularly desirable when irons are used on 220-volt circuits or on metal benches accommodating groups of operators.

The cord is held firmly in place by a strain-clamp.

American Beauty COPPER TIPS

American Beauty Copper Tips are made from commercially pure, drawn bar copper rod and are heavily nickeled to resist corrosion and oxidation. Standard shaped tips with which various models are equipped are shown in illustration but pyramidal, instead of chisel type, and vice versa can be supplied when so specified without additional charge. For No. 3138 a special long, semi-chisel shaped tip (No. 3738-S) can be supplied for telephone, switchboard, television and radio work.





American Beauty TEMPERATURE REGULATING STAND

For use on (AC) Alternating Current Only

This is a thermostatically controlled device for the regulation of the temperature of an Electric Soldering Iron while at rest. Through an adjustment on bottom of stand the thermostat may be set for maintenance of any desired heat—from very low, or warm, to full working temperature. It is designed for use with Electric Soldering Irons up to 660 watts capacity and on circuits up to 240 volts.

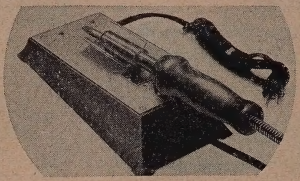
FOR FASTER SOLDERING... LONGER IRON LIFE

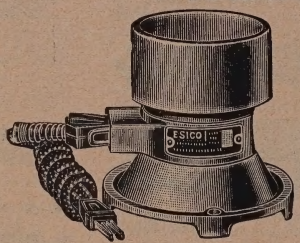
MAINTAINS DESIRED IRON TEMPERATURE BETWEEN JOBS ● PREVENTS OVERHEATING
SAVES ELECTRIC CURRENT ● ADJUSTABLE TO ANY SIZE IRON
SAVES TIME ● NO LONG WARM-UP PERIOD



A practical, time and money saving device which accurately regulates and maintains soldering iron temperature between jobs. Lengthens iron life by reducing tip oxidation and amalgamation of tip with solder which increases with over-heating.

When placed on stand, iron rests in a copper cradle which conducts heat of iron and actuates a bimetal to open or close a switch. Temperature is easily regulated by an adjusting slide at bottom of stand. As iron is removed from stand, full current is instantly supplied. Stem rest adjustable to accommodate various lengths of irons. Stand is a heavy gray iron casting—stays firmly fixed without being fastened.

● SOLDERING POTS



Ruggedly constructed, cast iron pots for production work. Elements are easily replaced even while pots are hot.

ERSIN

THREE CORE
SOLDER
CONTAINS 3 CORES OF NON-CORROSIVE FLUX

ACTUAL PERFORMANCE PROVES THAT ERSIN MULTICORE

- ***melts more rapidly due to multiple core construction***
- ***removes surface oxides and prevents reforming***
- ***bonds properly on difficult metals***
- ***saves money***
- ***saves time***

Ersin Multicore, containing Ersin Flux, is the finest solder available for use where cored solders are required. It is fast acting, flows readily, and bonds difficult metals surely, safely and economically. The technical advantages listed below explain "how" and "why".

Multicore Solder is specified by many of the largest television and electronics manufacturers, as well as thousands of service and repair men, who have tested it against all others and use it exclusively for their requirements.

Every reel or carton of Ersin Multicore is clearly marked both as to gauge and alloy, showing the actual content of Tin and Lead. You know exactly what you are getting when you buy Ersin Multicore Solder!

Available in all Tin/Lead alloys and in standard wire gauge from 10 to 22. (14, 16 and 18 s.w.g. are most popular.)

TECHNICAL ADVANTAGES:

ERSIN FLUX

Ersin Flux is exclusive to Multicore and will not be found in any other solder. It is a high grade, water white rosin, homogeneously activated.

Ersin Flux has a vigorous fluxing action while retaining the non-corrosive and protective features of the original rosin.

Soldered joints made with Ersin Flux do not corrode even after prolonged exposure to humidity. It has been tested under climatic conditions ranging from the Arctic to the Tropics.

Ersin Flux reduces the surface tension of molten solder, causing it to wet metals rapidly, increasing speed of operation with resultant production economies.

Free from objectionable odor. Non-toxic in use.

Leaves nothing but pure rosin on the work after soldering, and may be used wherever plain rosin is specified. Complies with all pertinent Federal Specifications.

MULTICORE SOLDER

Three separate cores of flux eliminate possibility of no flux in a portion of the wire, which may occur in single cored solder. Guaranteed continuity of the flux stream prevents "dry" joints, i.e. those having high electrical resistance.

Although there are three cores of flux in Multicore, the total percentage of flux to solder is less than many single cored solders.

Very rapid melting results from the multiple core construction which provides thinner walls of solder than are found in same gauge single cored solder.

Multicore's unique properties make perfect joints possible on difficult metals and alloys, even if oxidized.

Ability to tin rapidly produces perfect joints with less solder. Greater coverage per pound.

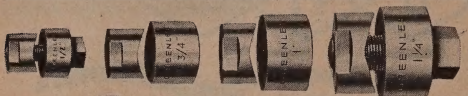
KNOCKOUT PUNCHES AND CUTTERS

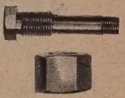
Greenlee Tool Co., Rockford, Illinois



NO. 735 KNOCKOUT PUNCH SET

Designed primarily for the electrical trade to permit fast, easy enlarging of knockouts and cutting of holes for conduit in metal boxes and cabinets. Also excellent for automobile work where holes are needed for heater pipes and other accessories. Simply insert the tool in a knockout or small drilled hole and give the screw a few turns with an ordinary wrench. No. 735 set has four punches for cutting ⅞, 1 3/32, 1 11/32, 1 11/16-inch holes for ½, ¾, 1, 1¼-inch conduit. Set is neatly packed in leather case illustrated. The ½-inch punch will cut a ⅞-inch hole for ½-inch conduit where no standard knockout is provided when a 7/16" hole is drilled.

Heavy Duty Drive for ½" Punch



To increase length of service of the ½-inch Knockout Punch in cutting ⅞-inch holes in heavier-gauge sheet metals, the No. 1387 AV Drive Screw with No. 1388 AV Drive Nut illustrated is recommended.

NO. 737 KNOCKOUT PUNCH SET

Similar to the No. 735 set, but consists of only two punches for cutting holes to accommodate 1½" and 2" conduit. Packed in leather case.

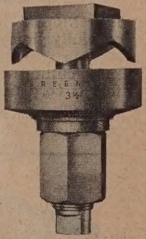
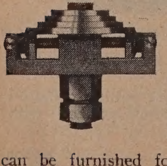
NOS. 741 AND 742 KNOCKOUT PUNCHES



For quickly making smooth openings for 3½" and 4" conduit. Hole is clean, no filing of burrs necessary. Operation is similar to that of other GREENLEE Knockout Punches. Simply insert in hole for 1" conduit and turn drive nut with an ordinary wrench.



No. 740 Knockout Cutter

WIDE SELECTION OF SHAPES AND SIZES

Shown above, are but a few of the many Rogan plastic knobs available to you from our regular stock molds. These are supplied without tool charge, resulting in considerable savings in cost, faster delivery. Choice of a wide selection of sizes, shapes and colors. Molded of phenolic or urea thermosetting materials, which will not soften, warp, or scratch easily. Heat resisting materials can be used so knobs can withstand 350-400° F. continuous heat. Most knobs supplied with 1/4" shaft hole and set screws. Special shaft hole sizes and means of fastening can be supplied to specifications at nominal cost.

KNOBS CAN BE BRANDED, AS REQUIRED

Rogan's famous "deep relief" branding process, applied after molding, provides sharp perfect marking at low cost. Any type marking, graduations or numerals can be branded on blank knobs to fit your requirements. Rogan knobs are available in black, brown or walnut, when molded of phenolic materials; and in all light pastel colors when molded of urea materials. Whatever your knob requirements may be, Rogan is equipped to supply you faster, better, more economically. The complete line of Rogan knobs with specifications is shown in the new Rogan catalog. SWITCHES

SINGLE AND MULTI-GANG CIRCUIT SELECTOR SWITCHES

This Selector Switch line is the result of several years' search for an ideal switch for all users. It has withstood the most severe tests, both electrically and mechanically. Breakdown tests show this switch will withstand voltages from 2700 between contacts and shaft to 4600 between adjacent clips.

The indexing of the Selector Switch is positive at all times. On the multiple position switches an adjustable stop is provided so that the user can adjust his switch to utilize only the number of positions required in his application.

Each switch is supplied with bar knob and all shafts are slotted in three positions, 1½", ¾" and ⅜" from the base of the bushing. The shaft can be placed in a vise next to the desired groove, and by tapping the end of the shaft with a hammer it will break off easily. No sawing is necessary. All switches are packed in individual boxes.

RMC DISCAP CERAMIC CONDENSERS

THE NEWEST DEVELOPMENT IN CERAMIC BY-PASS CONDENSERS

Type B Series DISCAPS are the smallest disc ceramics available. 1000 mmf. and 1500 mmf. DISCAPS are actually less than one-half the size of competitive condensers. Their low self inductance, low power factor and moisture impervious characteristics place them in a class alone. Approved by leading makers of TV sets and tuners as well as manufacturers of specialized high frequency equipment is proof of their superiority.

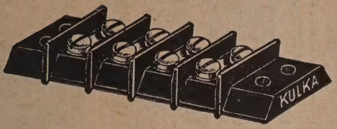
HEAVY DUTY BAKELITE BARRIER TERMINAL STRIPS



This latest type of construction of bakelite strip is made of molded bakelite of very high tensile strength. The barriers between each terminal prevent any possibility of short circuits and leakage between terminals. The terminals and screws are brass, nickel plated. The strips are manufactured by the KULKA ELECTRIC MFG. CO. INC., Design Patent No. 136, 762 and are exclusively distributed by us to the Radio Parts Distributors.

COLUMN A

All the Barrier Terminal Strips enumerated in this column for the 600, 601, 602 and 603 series are made with the screw type terminals exactly as shown in the illustration at top of the page.

INSTRUCTIONS — FOR MEASURING BELTS

To determine size of belt, if the old belt is available, cut the belt and measure for stretched out length. This will be "cut length" of belt.

If old belt is not available or is worn out so that it cannot be properly measured, stretch a thin thread around belt pulleys on set. (Be sure to use thin thread as a thick cord will give an inaccurate reading.) Measure the thread, it will be our "circumference around pulleys." In measuring belts always remember that the **circumference around pulleys** is not the same as **stretched out or cut length.** A belt when cut, develops approximately 3/16" extra length when stretched out, depending on thickness of belt.

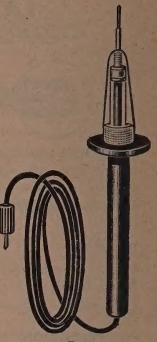
"KILOVOLTER" MULTIPLIER PROBE



A skilfully-made probe that combines the finest high voltage design principles with precision fabricating —a superb multiplier probe whose efficiency . . . sturdiness . . . popular price, is beyond compare.

Equipped with 15 K.V. range multiplier that provides full range PLUS existing meter voltage. For example, use of the ICA probe will increase the range of a 5,000-volt range voltmeter to 20,000 volts full scale.

The three (3) built-in 1% resistors (totaling 6 watts dissipation) are coaxially mounted, providing air-spacing to further assure heat dissipation and a completely insulated probe.

Highest grade components include sturdy thermoplastic barrel with safety finger guard and sealed ends. Over-all length: 8½". Supplied with 5-ft. heavy duty lead with insulated phone tip.
